

Error scenarios Timing Diagram

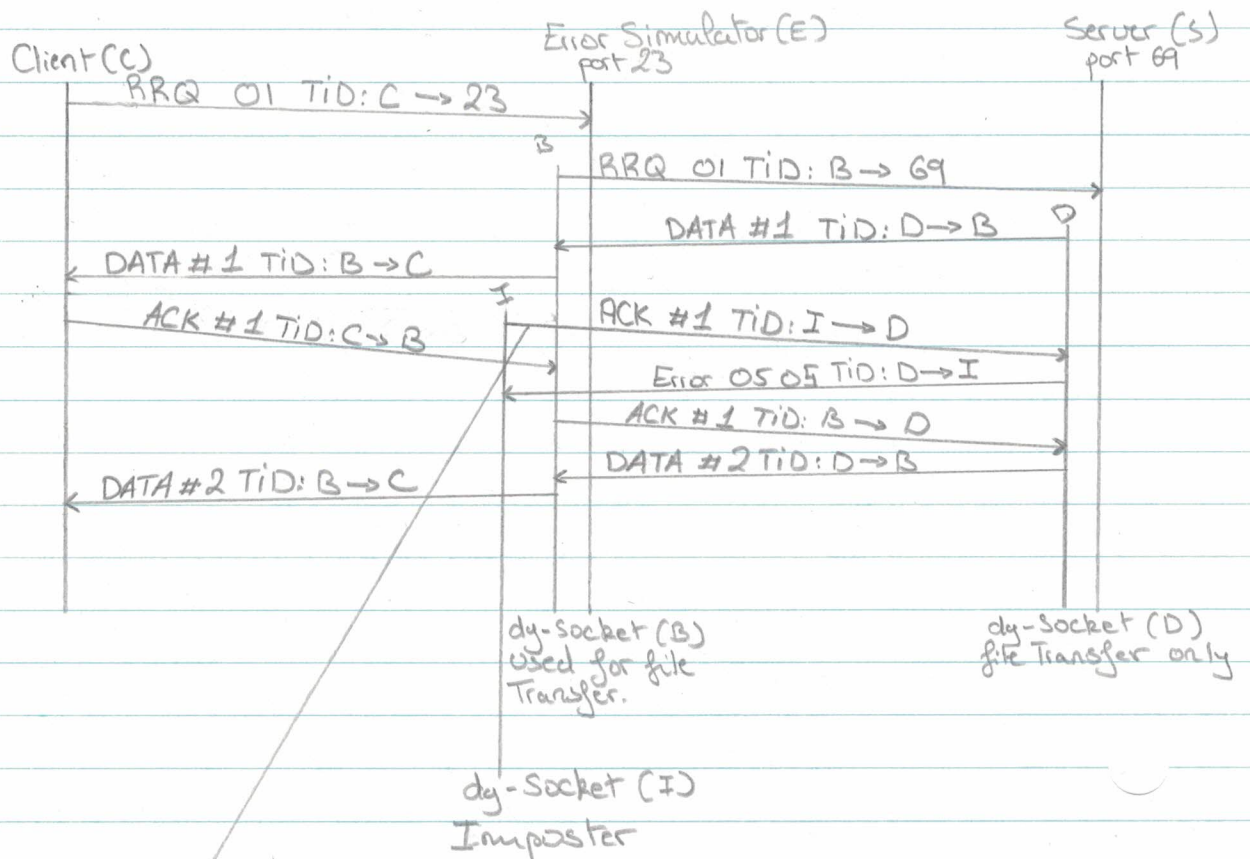

Error Simulator simulates an error by changing the opcode of a RRQ 01 to 02 (case 1) in the
The same would be done if we changed the opcode of a WRQ 02 to 01 (case 1).

Error Simulator Simulates one of the following errors:

- Change filename String (case 2)
- Modify Mode String (case 3)
- Change filename delimiter (case 4)
- Change Mode delimiter (case 5)

! Same timing diagram if we had a RRQ instead of a WRQ

Error Simulator simulates an unknown file transfer ID by creating a new Socket 'I' and sending an ACK or DATA block to port D. Port D receive messages only from port B. ∴ Case 6

⚠ It does not have to be a RRQ, it can also be a WRQ.
